**STORMWATER MANAGEMENT REPORT
FRANKLIN DRIVE SUBDIVISION
MULTI-FAMILY DEVELOPMENT &
COMMERCIAL DEVELOPMENT
WINDHAM, MAINE**

1. Introduction

This Stormwater Management Report has been prepared to address the potential impacts associated with the multi-family and commercial projects due to proposed modifications in stormwater runoff characteristics and land cover changes. The stormwater management controls that are outlined in this report have been designed to suit the proposed development and to comply with applicable regulatory requirements.

2. Existing Conditions

The project sites can be identified as Lot #1 and Lot #2 in the Franklin Drive Subdivision. The total subdivision consists of approximately 38.59 acres of undeveloped land located at 20 Franklin Drive in Windham, Maine. The subdivision is bounded by The Home Depot (part of the Windham Mall) to the south, the Windham Veterans Center to the east, and undeveloped land to the north and west. Lot #1 of the Franklin Drive Subdivision is approximately 3.35 acres and is bounded by the extension of Franklin Drive to the west, undeveloped land to the north, the Windham Veterans Center to the east, and land used for stormwater treatment from The Home Depot to the south. Lot #2 of the Franklin Drive Subdivision is approximately 7.88 acres and is bounded by The Home Depot (part of the Windham Mall) to the south, undeveloped land to the west, Lot #3 to the north, and the extension of Franklin Drive to the east.

The Franklin Drive Subdivision project was permitted and approved by the Town of Windham Planning Board on January 13th, 2025. This project included the subdivision of the existing parcel into four (4) lots (labeled Lot #1 through Lot #4) along with the extension of Franklin Drive along the frontage of the subject site. The applicant is proposing to develop Lots 1 through 3, starting with Lot 2 (this project)

Slopes on the site range from generally flat along Franklin Drive, but range from flat to steep throughout the wooded portion of the property. There are approximately 2.5 acres of steep slopes located throughout the site. There are approximately 13.4 acres of wetlands located on the site within Lot #3, including a vernal pool of special significance with an approximate size of 0.53 acres. Wetland and vernal pool delineations were conducted by Mark Hampton Associates and Flycatcher, respectively, in 2020.

Most of the site is located within the Sebago Lake Watershed. This lake is listed in Chapter 502 of the Maine Department of Environmental Protection (MDEP) regulations as a Lake

Most at Risk from New Development, but is not severely blooming. Phosphorus calculations have been included in Appendix A.

The proposed development area of the site is not located in an identified flood zone, nor is the site located in any Shoreland Zone. The site is located in the Commercial 1 (C-1) District and is identified on the Town of Windham Tax Map 18 as Lot 26-2-A.

3. Soils

Soil characteristics were obtained from the NRCS Web Soil Survey completed by Sebago Technics. The Hydrologic Groups (HSG) of the soils is classified by Technical Release TR-55 of the Soil Conservation Service as follows:

Soil Map Symbol	Soil Name	Slope (%)	HSG
HIB	Hinckley loamy sand	3-8	A
HgB	Hermon sandy loam	3-8	A
Wa	Walpole fine sandy loam	0-3	A/D
Sp	Sebago mucky peat	0-1	A/D

Hydrologic Soil Group boundaries are delineated on the Watershed Map. A copy of the Class D Medium Intensity Soil Survey is included as Appendix 4.

4. Proposed Site Improvements

The proposed development includes the construction of two (2) 150-unit residential buildings with resident amenities, landscaped areas, parking, sidewalks, and access driveways connecting to Franklin Drive. The project will also consist of associated grading, underground utility connections, and stormwater management infrastructure. The project will result in the creation of 7.7 acres of impervious area and 10.7 acres of total developed area.

5. Existing Conditions Model

The pre-development watershed plan consists of six (6) subcatchments labeled 1.0S, 1.1S, 2.0S, 2.1S, 3.0S, and 4.0S in the HydroCAD model. Four (4) locations were identified as Points of Analysis (POA) for comparing peak runoff rates. The first point of analysis represents an existing best management practice (BMP) that is located south of Franklin Drive, on the abutting property. The second point of analysis represents a significant vernal pool, which is located in the eastern portion of Lot #3. The third point of analysis represents a low point located in the northern corner of Lot #3 that contains a wetland. The fourth point of analysis represents the abutting property west of the subject site.

POA-1: Subcatchments 1.0S and 1.1S are tributary to this point of analysis with a combined area of approximately 8.5 acres. This area includes a portion of Franklin Drive, portions of the abutting properties along the southern border of the site, and a portion of both the cleared and wooded areas in the southern region of Lot #1 and Lot #2.

POA-2: Subcatchments 2.0S and 2.1S are tributary to this point of analysis with a cumulative area of approximately 8.2 acres. Subcatchment 2.0S includes the extension of Franklin Drive that was proposed and approved by the Town of Windham Planning Board in January 2025. This area is proposed to be treated by an underdrained soil filter that has an outlet pipe towards POA-2. Subcatchment 2.01S includes the majority of the wooded area in Lot #1 and a portion of the wooded area in Lot #3.

POA-3: Subcatchment 3.0S is tributary to this point of analysis with an area of approximately 5.1 acres. This area includes a portion of both the cleared and wooded areas in Lot #2 and a portion of the wooded area in Lot #3.

POA-4: Subcatchment 4.0S is tributary to this point of analysis within an area of approximately 0.9 acres. This area primarily consists of an undeveloped wooded area located in the northern portion of Lot #2.

The total acreage within this study is approximately 22.7 acres.

6. Proposed Conditions Model

The post-development watershed area consists of the same overall area as the pre-development plan; however, the pre-development subcatchments have been broken into smaller watersheds as a result of the proposed development. There is a total of nine (9) subcatchments in the proposed conditions model for a total area of approximately 22.7 acres.

The project is proposed to meet the flooding standard by infiltration of a portion of the runoff into the subsurface soils to mimic the existing on-site condition of the HSG A soils. Infiltration tests were performed by SW Cole and indicated infiltration rates of 18.7 and 22.9 in/hr. Treatment will occur in subsurface sand filters, and treated water will be directed to a secondary infiltration bed that has been conservatively designed for 10 in/hr.

POA1: Subcatchment 10.0S is tributary to this point of analysis with an approximate area of 4.7 acres. This area includes a portion of Franklin Drive, portions of the abutting properties along the southern border of the site, and a portion of both the cleared and wooded areas in the southern region of Lot #1 and Lot #2.

POA-2: Subcatchments 20.0S, 21.0S, and 22.0S are tributary to this point of analysis with a cumulative area of approximately 9.1 acres. Subcatchment 21.0S includes the extension

of Franklin Drive that was proposed and approved by the Town of Windham Planning Board in January 2025. This area is proposed to be treated by an underdrained soil filter that has an outlet pipe towards POA-2. Subcatchment 20.0S includes the majority of the wooded area in Lot #1 and a portion of the wooded area in Lot #3. Subcatchment 22.0S includes the proposed commercial development of Lot #1. Stormwater from this subcatchment will be treated by a subsurface sand filter to meet water quality treatment requirements, and will utilize a separate subsurface chamber system for detention and infiltration to meet flooding standards.

POA-3: Subcatchments 30.0S through 30.3S are tributary to this point of analysis with a cumulative area of approximately 8.3 acres. Stormwater from subcatchments 30.2S and 30.3S will flow to two (2) separate subsurface sand filters for water quality treatment. The stormwater from these subcatchments will then flow to a separate subsurface chamber system for detention and infiltration to meet flooding standards. Stormwater from subcatchment 30.1S will flow to a subsurface sand filter for both water quality treatment and detention to meet flooding standards.

POA-4: Subcatchment 4.0S is tributary to this point of analysis within an area of approximately 0.6 acres. This area primarily consists of an undeveloped wooded area located in the northern portion of Lot #2.

The proposed Best Management Practices (subsurface sand filters) have been designed and sized in accordance with DEP BMP standards contained within Chapter 500 and the BMP Manual. Sizing calculations can be found in Appendix 1.

7. Stormwater Management

Basic Standard - Chapter 500, Section 4(B)

Since the project will disturb more than one (1) acre of land area, MDEP Basic Standards apply, requiring that grading or other construction activities on the site do not impede or otherwise alter drainage ways to have an unreasonable adverse impact. We have avoided adverse impacts by providing an Erosion & Sedimentation Control Plan, and an Inspection, Maintenance, and Housekeeping Plan (Appendix 3) to be implemented during construction and post-construction stabilization of the site. These construction requirements have been developed following Best Management Practice guidelines.

General Standard - Chapter 500, Section 4(C)

Since the project will create more than one (1) acre of impervious surface, MDEP General Standards apply, which require a project's stormwater management system to include treatment measures that will mitigate for the increased frequency and duration of channel erosive flows due to runoff from smaller storms, provide for effective treatment of pollutants in stormwater, and mitigate potential temperature impacts. The General

Standards require treatment of no less than 95% of the site's created impervious area and no less than 80% of the site's created developed area (landscaped area and impervious area combined).

To mitigate the changes in hydrologic patterns due to this phase of the development, three (3) subsurface sand filters with associated subsurface chamber systems have been implemented into the stormwater management infrastructure. Filtration BMPs are very effective at removing a wide range of pollutants through the use of granular filter media.

Through the use of the aforementioned BMP's at least 95% of new impervious area and at least 80% of new developed area will be receiving treatment. This meets the requirements for the Maine DEP General Standards. BMP sizing and treatment calculations are provided as Appendix 1.

Phosphorus Standard - Chapter 500, Section 4(D)

As stated previously, Sebago Lake is identified as a Lake Most at Risk, but not categorized as severely blooming, as referenced in MDEP Chapter 502. Therefore, because the project results in 1 acre or more of impervious area, the project is subject to the Phosphorus Standards of MDEP Chapter 500.

Four (4) subsurface chamber systems with subsurface sand filters are proposed for the treatment of stormwater runoff generated by the proposed development. Two (2) separate subsurface chamber systems are proposed for the attenuation of stormwater runoff. The BMPs have been designed per the MDEP Stormwater BMP Manual, as well as Volume II: Phosphorus Control Manual of the Maine Stormwater Management Design Manual. The subsurface filtration strategy was chosen as the most appropriate BMP for this project since it provides an effective means of filtration for contaminants commonly found in stormwater and is the best fit for the current site constraints.

A per-acre phosphorus allocation calculation was completed for the project using the High Export Option to determine if the allowable per-acre phosphorus allocation for the Sebago Lake Watershed is achieved. The total acreage of the development parcel is approximately 38.6 acres. The wetland area was obtained using NWI wetlands, as well as wetlands mapped by Mark Hampton, and is equal to 13.4 acres. Steep slope areas (slopes greater than 25%) equal 2.5 acres. Therefore, the project phosphorus budget for the project parcel is equal to 1.20 lbs. P/year. The pre-treatment phosphorus export (pre-PPE) was calculated to be 10.46 lbs. P/year. With the implementation of the proposed stormwater treatment for newly developed areas, approximately 3.84 lbs. P/year (post-PPE) will be exported off-site in the proposed condition. Since the post-treatment phosphorus export is larger than the pre-treatment phosphorus export, the project is proposing mitigation by paying the compensation fee. Calculations associated with the removal of phosphorus can be referenced in Appendix 1.

Flooding Standard - Chapter 500, Section 4(F)

The proposed project will create more than three (3) acres of impervious surface, MDEP Flooding Standards must be met. The Flooding Standard requires that a project's stormwater management system detain, retain, or result in the infiltration of stormwater from 24-hour storms of the 2, 10, and 25-year frequencies such that the peak flows of stormwater from the project site do not exceed the peak flows of stormwater prior to undertaking the project. As such, a runoff evaluation was performed using the methodology outlined in the USDA Soil Conservation Service's "Urban Hydrology for Small Watersheds - Technical Release #55 (TR-55)". HydroCAD computer software was utilized to perform the calculations.

HydroCAD Stormwater Analysis

Runoff curve numbers were determined for each of the watersheds by measuring the area of each hydrologic soil group within each type of land cover. The type of land cover was determined based on survey data, field reconnaissance and aerial photography. Times of concentration were determined from site topographic maps in accordance with SCS procedures.

The 24-hour rainfall values utilized in the hydrologic model were obtained from Appendix H of MDEP's Chapter 500: Stormwater Management (effective date August 2015). Rainfall values for York County are listed in the table below.

Storm Frequency Precipitation (in./24 hr)	
York County	
2-year	3.3
10-year	4.9
25-year	6.2

The following table presents the results of the peak runoff calculations at the analysis points for the existing and proposed conditions.

Peak Runoff Rate Summary Table			
Analysis Point	Storm Event	Existing Conditions (cfs)	Proposed Conditions (cfs)
POA-1	2-year	0.9	0.7
	10-year	1.4	1.0
	25-year	1.8	1.3
POA-2	2-year	1.4	1.4
	10-year	2.1	2.1
	25-year	2.7	2.7

POA-3	2-year	0.2	0.1
	10-year	0.4	0.2
	25-year	0.5	0.3
POA-4	2-year	0.0	0.0
	10-year	0.0	0.0
	25-year	0.0	0.0

The HydroCAD Data output sheets from this analysis are appended to this report (Appendix 2) along with the Stormwater Management Plans (Appendix 5). The model predicts that the peak runoff rates in the post-development condition at the points of analysis are at or below pre-development runoff rates for the 2, 10, and 25-year storm events with implementation of the proposed stormwater management practices.

8. Summary

The proposed development has been designed to manage stormwater runoff through Best Management Practices approved by MDEP. Stormwater BMPs provide treatment to at least 95% of impervious areas, and at least 80% of the total developed area. Runoff discharging from the site will be at or below pre-development conditions for the 2, 10, and 25-year storm events at all four points of analysis. Additionally, erosion and sedimentation controls, along with associated maintenance and housekeeping procedures, have been outlined to prevent unreasonable impacts on the site and the surrounding environment.

UNDERDRAINED SUBSURFACE SAND FILTER									
Task:	Calculate water quality volume per MDEP chapter 500 regulations								
References	1. Maine DEP Chapter 500, Section 4.C.(3)(b)								
	"must detain a runoff volume equal to 1.0 inch times the subcatchment's impervious area plus 0.4 inch times the subcatchment's landscaped area"								
	2. Maine DEP Best Management Practices Stormwater Manual, Section 7.3.2								
	a.	"detain runoff volume equal to 1.0 inch times the subcatchment's impervious area plus 0.4 inch times the subcatchment's landscaped area"							
	b.	"surface area of the sand filter bed and chamber system must be at least equal to 5% of the impervious area draining to it and 2% of the landscaped area."							
	c.	"treatment flow rate for the Stormtech Isolator Row is the projected one year peak flow rate for the drainage area feeding the Isolator Row"							
		Flow rates:							
		SC-310	0.10	cfs/chamber					
		SC-740	0.20	cfs/chamber					
		DC-780	0.20	cfs/chamber					
		MC-3500	0.30	cfs/chamber					
	d.	Inspection ports to the underdrain gravel layer should be provided with at least one port per 500 square-feet of subsurface filter area.							
Tributary to Subsurface Sand Filter		SSF-3							
	Landscaped Area	9,456.00	SF						
	Impervious Area	42,649.00	SF						
Minimum Surface Area for sand filter and chamber system									
	Required	(2% X Landscaped + 5% X Impervious)							
	Total Landscaped Area	9,456.00	SF	Area	189.1	SF			
	Total Impervious Area	42,649.00	SF	Area	2,132.5	SF			
	Required Minimum Surface Area				2,321.6	SF			
	Provided Surface Area				6,731.0	SF		Required No. of Inspection Ports	
							14		
Treatment Volume									
	Required	(0.4" X Landscaped + 1.0" X Impervious)							
	Landscaped Area	9,456.00	SF	Volume	315.2				
	Impervious Area	42,649.00	SF	Volume	3,554.1				
	Treatment Volume Required				3,869.3	CF	0.089	AF	
	Provided Treatment Volume				9,061.0	CF	WQV Elev.= 310.35		
Sediment Pre-Treatment									
	Per Reference 2.c above								
	One year flow rate out put from Hydrocad:				1.80	cfs			
	ISO Row sizing for:				SC-740	0.2	cfs		
	Total number of Isolator Row Chambers required:				9

UNDERDRAINED SUBSURFACE SAND FILTER									
Task:	Calculate water quality volume per MDEP chapter 500 regulations								
References	1. Maine DEP Chapter 500, Section 4.C.(3)(b)								
	"must detain a runoff volume equal to 1.0 inch times the subcatchment's impervious area plus 0.4 inch times the subcatchment's landscaped area"								
	2. Maine DEP Best Management Practices Stormwater Manual, Section 7.3.2								
	a.	"detain runoff volume equal to 1.0 inch times the subcatchment's impervious area plus 0.4 inch times the subcatchment's landscaped area"							
	b.	"surface area of the sand filter bed and chamber system must be at least equal to 5% of the impervious area draining to it and 2% of the landscaped area."							
	c.	"treatment flow rate for the Stormtech Isolator Row is the projected one year peak flow rate for the drainage area feeding the Isolator Row"							
		Flow rates:							
		SC-310	0.10	cfs/chamber					
		SC-740	0.20	cfs/chamber					
		DC-780	0.20	cfs/chamber					
		MC-3500	0.30	cfs/chamber					
	d.	Inspection ports to the underdrain gravel layer should be provided with at least one port per 500 square-feet of subsurface filter area.							
Tributary to Subsurface Sand Filter		SSF-4							
Landscaped Area		27,455.00	SF						
Impervious Area		92,992.00	SF						
Minimum Surface Area for sand filter and chamber system									
Required		(2% X Landscaped + 5% X Impervious)							
Total Landscaped Area		27,455.00	SF	Area	549.1	SF			
Total Impervious Area		92,992.00	SF	Area	4,649.6	SF			
Required Minimum Surface Area					5,198.7	SF			
Provided Surface Area					5,208.0	SF		Required No. of Inspection Ports	
							11		
Treatment Volume									
Required		(0.4" X Landscaped + 1.0" X Impervious)							
Landscaped Area		27,455.00	SF	Volume	915.2				
Impervious Area		92,992.00	SF	Volume	7,749.3				
Treatment Volume Required					8,664.5	CF	0.199	AF	
Provided Treatment Volume					9,832.0	CF	WQV Elev.= 316.67		
Sediment Pre-Treatment									
Per Reference 2.c above									
One year flow rate out put from Hydrocad:				1.80	cfs

ORIFICE SIZING CALCULATION**Stormwater BMP:**

SSF-4

Orifice Equation

$$Q = CA \sqrt{2gh}$$

Q = Rate of Discharge (cfs)

A = Orifice Area (sf)

G = Gravitational Constant (32.2 ft/s²)

h = Depth of water above the flow line (center) of the orifice (ft)

C = 0.6 Orifice coefficient (usually assumed = 0.6)

Average discharge rate required to drawdown the treatment volume in a desired amount of time is:

$$Q = \frac{WQ_v}{T_{cf}}$$

TV = Treatment Volume (cf)

T = Target Drain Time (Hours)

cf = Conversion Factor = 3600 sec/hr

TV = 8,664 cf

t = 24 hr

$$Q = \frac{TV}{tCF} = 0.10 \text{ cfs} \quad \text{Target Rate for } 24 \text{ hour discharge}$$

surface area of filter = 5,197 SF

hmax = 1.67 ft h/2 = 0.83 ft

$$A = \frac{Q}{C \sqrt{2gh}} = 0.023 \text{ sf} = 3.28 \text{ sq. in.}$$

Diam = 2.05 in

Worksheet 1 - PPB calculations			
Project Name:	Franklin Drive Multi-Family Development		
Lake Watershed:	Sebago Lake		
Town: Windham, ME			
Standard Calculations			
Watershed per acre phosphorus budget (Appendix C)	PAPB	0.053	lbs P/acre/year
Total acreage of development parcel:	TA	38.6	acres
NWI wetland acreage:	WA	13.4	acres
Steep slope acreage:	SA	2.5	acres
Project acreage: $A = TA - (WA + SA)$	A	22.69	acres
Project Phosphorus Budget: $PPB = P \times A$	PPB	1.20257	lbs P/year
Small Watershed Adjustment			
If Project Acreage (A) is greater than the threshold acreage for the small watershed threshold (SWT, from pertinent lake and town info in the table in Appendix C), calculate an alternative PPB using the analysis below and use this value if it is less than the the Standard Calculation PPB.			
Small Watershed Threshold (Appendix C):	SWT		acres
Project acreage:	A		acres
Allowable increase in town's share of annual phosphorus load to lake (Appendix C):	FC		lbs P/year
Area available for development (Appendix C):	AAD		acres
Ratio of A to AAD ($R = A/AAD$)	R		
Project Phosphorus Budget			
If $R < 0.5$, $PPB = [(FC \times R)/2] + [FC/4]$	PPB		lbs P/year
If $R > 0.5$, $PPB = FC \times R$	PPB		lbs P/year

Worksheet 2

Pre-PPE and Post-PPE Calculations

Calculate phosphorus export from development for before and after treatment
Use as many sheets as needed for each development type (commercial, roads, residential lots, etc.)

Total source elimination mitigation credit (SEC)								0	lbs P/year

Mitigation credit when a pre-existing source is treated by a new BMP

Mitigation Source Area Land Use	Acres	Export Coefficient (lbs P/acre/year)	Modifier	Pre-treatment Historical P Export (lbs P/year)	Treatment Factor for Historical BMP(s) (1.0 if no BMPs)	Historical P Export (lbs P/year)	Treatment Factor for New BMP(s) Chapter 6	Mitigation Credit (lbs P/year)	Comments
			0.5	0	1	0	1 -	0	
			0.5	0	1	0	1 -	0	
			0.5	0	1	0	1 -	0	
Total source treatment mitigation credit (STC)								0	lbs P/year

TOTAL MITIGATION CREDIT (SEC + STC) 0 lbs P/year

WORKSHEET 4 - PROJECT PHOSPHORUS EXPORT SUMMARY

Summarizing the project's algal available phosphorus export (PPE)

Project Name: Franklin Drive Multi-Family Development

Project Phosphorus Budget - Worksheet 1	PPB	1.20	lbs P/year
Total Pre-Treatment Phosphorus Export - Worksheet 2	Pre-PPE	10.22	lbs P/year
Total Post-Treatment Phosphorus Export - Worksheet 2	Post-PPE	3.52	lbs P/year
Total Phosphorus Mitigation Credit - Worksheet 3	TMC	0.00	lbs P/year
Project Phosphorus Export (Post-PPE - TMC)	PPE	3.52	lbs P/year

Is the Project Phosphorus Export \leq the Project Phosphorus Budget? (PPE \leq PPB)

If **YES**, PPE is less than or equal to PPB and the project meets its phosphorus budget.
If **NO**, PPE is greater than PPB, more reduction in phosphorus export is required or the payment of a compensation fee may be an option

NO

The amount of phosphorus that needs further treatment or compensation

2.32 lbs P/year

Has Project Phosphorus Export been sufficiently reduced?

Is (Pre-PPE - Post-PPE)/Pre-PPE greater than 0.60?

If **YES**, in some watersheds the compensation fee is an available option.
If **NO**, more treatment must be provided. PPE must be further reduced.

YES

The post-treatment phosphorus export must be less than 40% of the pre-treatment export (Post-PPE < 0.4*Pre-PPE)

65.53 %

If the project is located in a watershed that is eligible for a compensation fee (or is a residential subdivision with buffers), a compensation fee may be appropriate as follows:

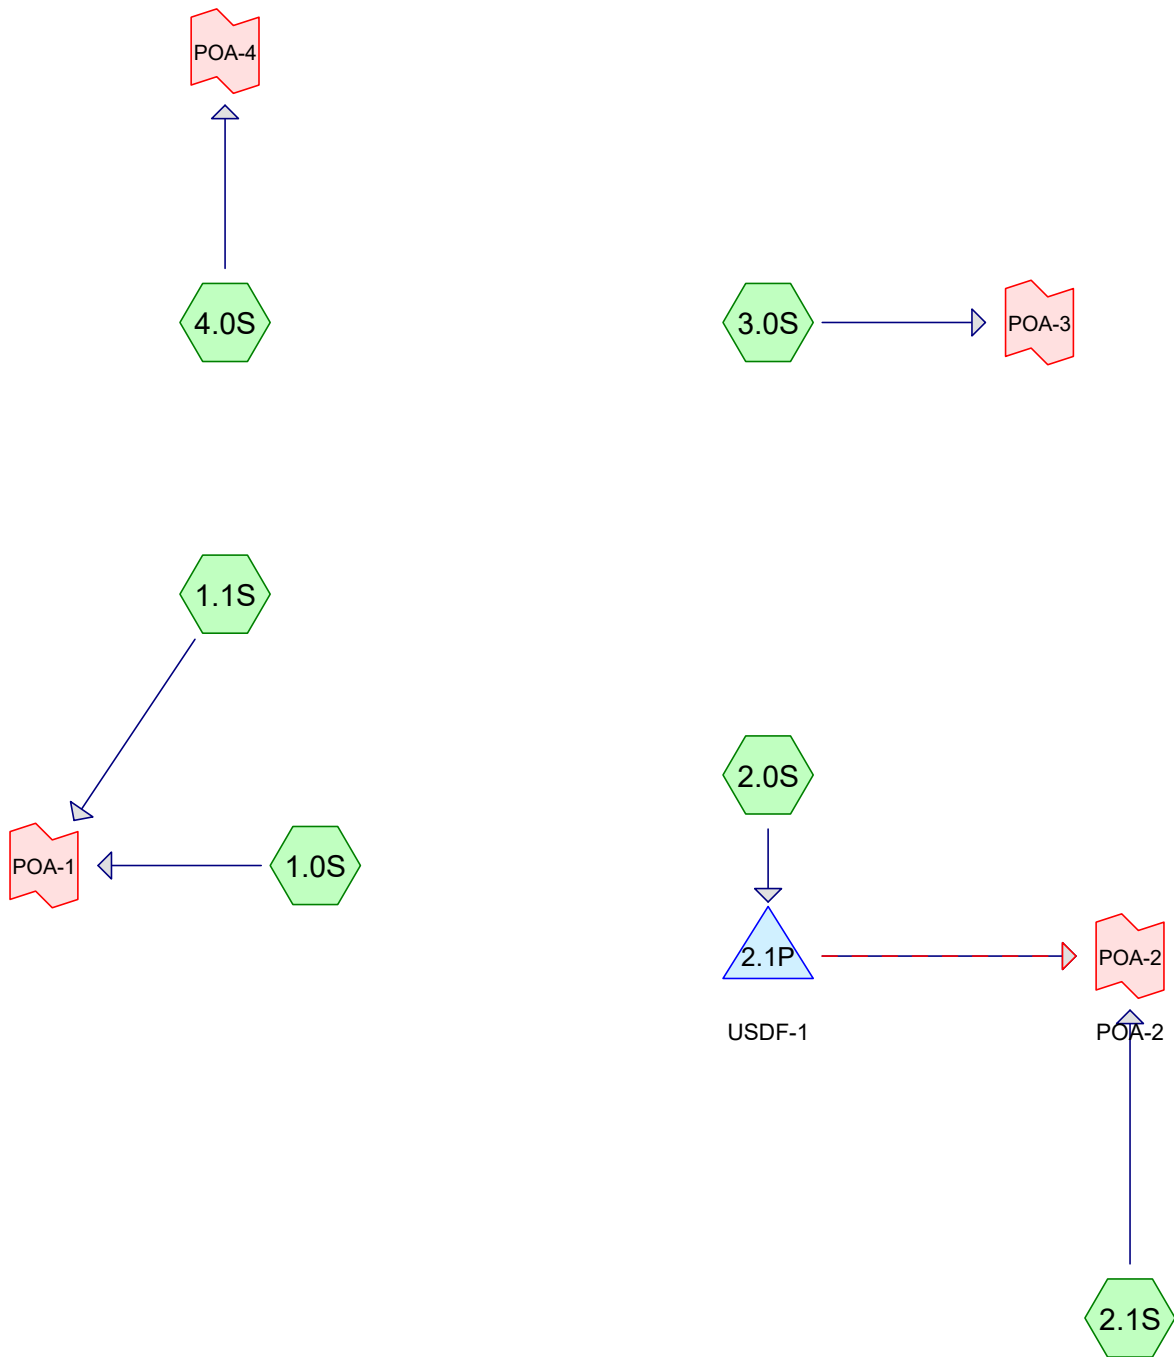

If Project Export has been reduced by greater than 60% and less than 75%, \$25,000 per pound minus \$833 per 1% Percent Export

\$47,343

If Project Export has been reduced by greater than 75%, \$12,500 per pound minus \$500 per 1% Project Export

Appendix 3

Inspection, Maintenance and Housekeeping Plan

INSPECTION, MAINTENANCE, AND HOUSEKEEPING PLAN

For:

Franklin Drive Subdivision
Multi-Family Development &
Commercial Development
Windham, ME

By:

Sebago Technics, Inc.
75 John Roberts Road, Suite 4A
South Portland, Maine

Introduction

The following plan outlines the anticipated inspection and maintenance procedures for the erosion and sedimentation control measures as well as stormwater management facilities for the project. This plan also outlines several housekeeping requirements that shall be followed during and after construction. These procedures shall be followed in order to ensure the intended function of the designed measures and to prevent unreasonably adverse impacts to the surrounding environment.

The procedures outlined in this Inspection, Maintenance and Housekeeping Plan are provided as an overview of the anticipated practices to be used on this site. In some instances, additional measures may be required due to unexpected conditions. For additional detail on any of the erosion and sedimentation control measures or stormwater management devices to be utilized on this project, refer to the most recently revised edition of the "Maine Erosion and Sedimentation Control BMP" manual and/or the "Stormwater Management for Maine: Best Management Practices" manual as published by the Maine Department of Environmental Protection (MDEP).

During Construction

1. **Inspection:** During the construction process, it is the Contractor's responsibility to comply with the inspection and maintenance procedures outlined in this section. These responsibilities include inspecting disturbed and impervious areas, erosion control measures, materials storage areas that are exposed to precipitation, and locations where vehicles enter or exit the site. These areas shall be inspected at least once a week as well as before and after a storm event (0.5" of rainfall), and prior to completing permanent stabilization measures. A person with knowledge of erosion and stormwater control, including the standards and conditions in any applicable permits, shall conduct the inspections.
2. **Maintenance:** All measures shall be maintained in an effective operating condition until areas are permanently stabilized. If Best Management Practices (BMPs) need to be maintained or modified, additional BMPs are necessary, or other corrective action is needed, implementation must be completed within 7 calendar days and prior to any storm event (0.5" of rainfall).
3. **Documentation:** A log summarizing the inspections and any corrective action taken must be maintained on-site. The log must include the name(s) and qualifications of the person making the inspections, the date(s) of the inspections, and major observations about the operation and

maintenance of erosion and sedimentation controls, material storage areas, and vehicle access points to the site. Major observations must include BMPs that need maintenance, BMPs that failed to operate as designed or proved inadequate for a particular location, and locations where additional BMPs are needed. For each BMP requiring maintenance, BMP needing replacement, and location needing additional BMPs, note in the log the corrective action taken and when it was taken. The log must be made accessible to the appropriate regulatory agency upon request. The permittee shall retain a copy of the log for a period of at least three years from the completion of permanent stabilization.

4. **Specific Inspection and Maintenance Tasks:** The following is a list of erosion control and stormwater management measures and the specific inspection and maintenance tasks to be performed during construction.

A. Sediment Barriers:

- Hay bale barriers, silt fences, and filter berms shall be inspected immediately after each rainfall and at least daily during prolonged rainfall.
- If the fabric on a silt fence or filter barrier should decompose or become ineffective prior to the end of the expected usable life, and the barrier is still necessary, it shall be replaced.
- Sediment deposits should be removed after each storm event (0.5" of rainfall). They must be removed before deposits reach approximately one-half the height of the barrier.
- Filter berms shall be reshaped as needed.
- Any sediment deposits remaining in place after the silt fence or filter barrier is no longer required should be dressed to conform to the existing grade, prepared, and seeded.

B. Riprap Materials:

- Once a riprap installation has been completed, it should require very little maintenance. It shall, however, be inspected periodically to determine if high flows have caused scour beneath the riprap or dislodged any of the stone.

C. Erosion Control Blankets:

- Inspect these reinforced areas semi-annually and after significant rainfall events for slumping, sliding, seepage, and scour. Pay close attention to unreinforced areas adjacent to the erosion control blankets, which may experience accelerated erosion.
- Review all applicable inspection and maintenance procedures recommended by the specific blanket manufacturer. These tasks shall be included in addition to the requirements of this plan.

D. Stabilized Construction Entrances/Exits:

- The exit shall be maintained in a condition that will prevent tracking of sediment onto public rights-of-way.
- When the control pad becomes ineffective, the stone shall be removed along with the collected soil material. The entrance should then be reconstructed.

- Areas that have received mud-tracking or sediment deposits shall be swept or washed. Washing shall be done on an area stabilized with aggregate, which drains into an approved sediment-trapping device (not into storm drains, ditches, or waterways).

E. Temporary Seed and Mulch:

- Mulched areas should be inspected after rain events to check for rill erosion.
- If less than 90% of the soil surface is covered by mulch, additional mulch shall be applied in bare areas.
- In applications where seeding and mulch have been applied in conjunction with erosion control blankets, the blankets must be inspected after rain events for dislocation or undercutting.
- Mulch shall continue to be reapplied until 95% of the soil surface has established temporary vegetative cover.

F. Stabilized Temporary Drainage Swales:

- Sediment accumulation in the swale shall be removed once the cross-section of the swale is reduced by 25%.
- The swales shall be inspected after rainfall events. Any evidence of sloughing of the side slopes or channel erosion shall be repaired, and corrective action should be taken to prevent the reoccurrence of the problem.
- In addition to the stabilized lining of the channel (i.e., erosion control blankets), stone check dams may be needed to further reduce channel velocity.

5. **Housekeeping:** The following general performance standards apply to the proposed project.

- A. Spill prevention: Controls must be used to prevent pollutants from being discharged from materials on-site, including storage practices to minimize exposure of the materials to stormwater, and appropriate spill prevention, containment, and response planning and implementation.
- B. Groundwater protection: During construction, liquid petroleum products and other hazardous materials with the potential to contaminate groundwater may not be stored or handled in areas of the site draining to an infiltration area. An "infiltration area" is any area of the site that, by design or as a result of soils, topography, and other relevant factors, accumulates runoff that infiltrates into the soil. Dikes, berms, sumps, and other forms of secondary containment that prevent discharge to groundwater may be used to isolate portions of the site for the purposes of storage and handling of these materials.
- C. Fugitive sediment and dust: Actions must be taken to ensure that activities do not result in noticeable erosion of soils or fugitive dust emissions during or after construction. Oil may not be used for dust control.
- D. Debris and other materials: Litter, construction debris, and chemicals exposed to stormwater must be prevented from becoming a pollutant source.
- E. Trench or foundation dewatering: Trench dewatering is the removal of water from

trenches, foundations, cofferdams, ponds, and other areas within the construction area that retain water after excavation. In most cases, the collected water is heavily silted and hinders correct and safe construction practices. The collected water must be removed from the ponded area, either through gravity or pumping, and must be spread through natural wooded buffers or removed to areas that are specifically designed to collect the maximum amount of sediment possible, like a cofferdam sedimentation basin. Avoid allowing the water to flow over disturbed areas of the site. Equivalent measures may be taken if approved.

Post-Construction

1. **Inspection:** After construction, it is the responsibility of the owner or assigned heirs to comply with the inspection and maintenance procedures outlined in this section. All measures must be maintained in an effective operating condition. The owner shall inspect and maintain the BMPs, including but not limited to any parking areas, catch basins, drainage swales, detention basins and ponds, pipes and related structures, in accordance with all municipal and state inspection, cleaning, and maintenance requirements of the approved post-construction stormwater management plan.
2. **Specific Inspection and Maintenance Tasks:** The following is a list of permanent erosion control and stormwater management measures and the inspection and maintenance tasks to be performed after construction. If the BMP requires maintenance, repair or replacement to function as intended by the approved post-construction stormwater management plan, the owner or operator of the BMP shall take corrective action(s) to address the deficiency or deficiencies as soon as possible after the deficiency is discovered and shall provide a record of the deficiency and corrective action(s) to the local municipality in the annual report.

A. Vegetated Areas:

- Inspect vegetated areas, particularly slopes and embankments, early in the growing season or after heavy rains (>0.5") to identify active or potential erosion problems.
- Replant bare areas or areas with sparse growth. Where rill erosion is evident, armor the area with an appropriate lining or divert the erosive flows to on-site areas able to withstand the concentrated flows.

B. Ditches, Swales, and Other Open Channels:

- Inspect ditches, swales, level spreaders, and other open stormwater channels in the spring, in the late fall, and after heavy rains to remove any obstructions to flow. Remove accumulated sediments and debris, remove woody vegetative growth that could obstruct flow, and repair any erosion of the ditch lining.
- Vegetated ditches must be mowed at least annually or otherwise maintained to control the growth of woody vegetation and maintain flow capacity.
- Any woody vegetation growing through riprap linings must also be removed. Repair any slumping side slopes as soon as practicable.
- If the ditch has a riprap lining, replace riprap in areas where any underlying filter fabric or underdrain gravel is showing through the stone or where stones have dislodged.

C. Culverts:

- Inspect culverts in the spring, in the late fall, and after heavy rains (>0.5") to remove any obstructions to flow.
- Remove accumulated sediments and debris at the inlet, at the outlet, and within the conduit.
- Inspect and repair any erosion damage at the culvert's inlet and outlet.

D. Removal of Winter Sand:

- Clear accumulations of winter sand in parking lots and along roadways at least once a year, preferably in the spring.
- Accumulations on pavement may be removed by pavement sweeping.
- Accumulations of sand along road shoulders may be removed by grading excess sand to the pavement edge and removing it manually or by a front-end loader or other acceptable method.

E. Underdrained Soil Filters:

- The basin should be inspected semi-annually and following major storm events. Debris and sediment buildup should be removed from the forebay and basin as needed. Any bare area or erosion rills should be repaired with new filter media, seeded, and mulched.
- A legal entity should be established with responsibility for inspecting and maintaining any underdrained filter. The legal agreement establishing the entity should list specific maintenance responsibilities (including timetables) and provide for the funding to cover long-term inspection and maintenance.
- The filter should drain within 24 to 48 hours following a one-inch storm or greater. If the system drains too fast, an orifice may need to be added on the underdrain outlet or may need to be modified if already present.
- Sediment and plant debris should be removed from the pretreatment structure at least annually.
- If mowing is desired, only hand-held string trimmers or push-mowers are allowed on the filter (no tractor), and the grass bed should be mowed no more than 2 times per growing season to maintain grass heights of no less than 6 inches.
- Fertilization of the underdrained filter area should be avoided unless necessary to establish vegetation.
- Harvesting and pruning of excessive growth should be done occasionally. Weeding to control unwanted or invasive plants may also be necessary.
- Maintaining a healthy cover of grass will minimize clogging with fine sediments. If ponding exceeds 48 hours, the top of the filter bed should be rototilled to reestablish the soil's filtration capacity.
- The top several inches of the filter can be replaced with fresh material if water is ponding for more than 72 hours, or the basin can be rototilled, seeded, and mulched. Once the filter is mature, adding new material (a 1-inch to 2-inch cover of mature compost) can compensate for subsidence.

F. Subsurface Sand Filter Chamber System:

- Inspect the site monthly for the first few months after construction. Then inspections can occur on an annual basis, preferably after rain events when clogging will be obvious.
- Make any repairs necessary to ensure the measure is operating properly.
- Regular maintenance is necessary to remove surface sediment, trash, debris, and leaf litter.
- Outlets and chambers need to be cleaned/repared when drawdown times in the filter exceeds 36 hours.
- In certain cases, layers of sand may need to be replaced every 3 to 5 years.

3. **Documentation:**

- A. The owner or operator of a BMP or a qualified post-construction stormwater inspector hired by that person, shall, as required by the local municipality, provide a completed and signed certification on a form provided by the local municipality, certifying that the person has inspected the BMP(s) and that they are adequately maintained and functioning as intended by the approved post-construction stormwater management plan, or that they required maintenance or repair, including the record of the deficiency and corrective action(s) taken.
- B. A log summarizing the inspections and any corrective action taken must be maintained. The log must include the name(s) and qualifications of the person making the inspections, the date(s) of the inspections, and major observations about the operation and maintenance of controls. Major observations must include BMPs that need maintenance, BMPs that failed to operate as designed or proved inadequate for a particular location, and locations where additional BMPs are needed. For each BMP requiring maintenance, BMP needing replacement, and location needing additional BMPs, note in the log the corrective action taken and when it was taken. The log must be made accessible to the appropriate regulatory agency upon request. A sample "Stormwater Inspection and Maintenance Form" has been included as Attachment 1 of this Inspection, Maintenance, and Housekeeping Plan.

4. **Duration of Maintenance:** Perform maintenance as described and required for any associated permits unless and until the system is formally accepted by a municipality or quasi-municipal district, or is placed under the jurisdiction of a legally created association that will be responsible for the maintenance of the system. If a municipality or quasi-municipal district chooses to accept a stormwater management system, or a component of a stormwater system, it must provide a letter to the MDEP stating that it assumes responsibility for the system. The letter must specify the components of the system for which the municipality or district will assume responsibility, and that the municipality or district agrees to maintain those components of the system in compliance with MDEP standards. Upon such assumption of responsibility and approval by the MDEP, the municipality, quasi-municipal district, or association becomes a co-permittee for this purpose only and must comply with all terms and conditions of the permit.

ATTACHMENT 1 – STORMWATER INSPECTION AND MAINTENANCE LOG

**Franklin Drive Subdivision
Multi-Family Development &
Commercial Development
20 Franklin Drive
Windham, Maine**

This log is intended to accompany the Inspection, Maintenance, and Housekeeping Plan for the multi-family development located along Franklin Drive in Windham, Maine. The following items shall be checked, cleaned, and maintained on a regular basis as specified in the Maintenance Plan and as described in the sections below. This log shall be kept on file for a minimum of five (5) years and shall be available for review by the Town of Windham and the Maine DEP. Qualified personnel familiar with the drainage systems and soils shall perform all inspections. A copy of the construction and post-construction maintenance logs is provided.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Cumberland County and Part of Oxford County, Maine
Survey Area Data: Version 20, Sep 5, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 22, 2021—Oct 7, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background

MAP LEGEND

MAP INFORMATION

imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
DeB	Deerfield loamy fine sand, 3 to 8 percent slopes	1.5	4.0%
HgB	Hermon sandy loam, 3 to 8 percent slopes	6.1	15.8%
HhC	Hermon sandy loam, 8 to 15 percent slopes, very stony	2.1	5.4%
HIB	Hinckley loamy sand, 3 to 8 percent slopes	12.0	31.2%
Sp	Sebago mucky peat	8.6	22.2%
Wa	Walpole fine sandy loam	8.3	21.4%
Totals for Area of Interest		38.6	100.0%

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it

was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Cumberland County and Part of Oxford County, Maine

DeB—Deerfield loamy fine sand, 3 to 8 percent slopes

Map Unit Setting

National map unit symbol: 2xfg9

Elevation: 0 to 1,190 feet

Mean annual precipitation: 36 to 71 inches

Mean annual air temperature: 39 to 55 degrees F

Frost-free period: 145 to 240 days

Farmland classification: Farmland of statewide importance

Map Unit Composition

Deerfield and similar soils: 85 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Deerfield

Setting

Landform: Outwash deltas, outwash terraces, outwash plains, kame terraces

Landform position (three-dimensional): Tread

Down-slope shape: Concave, convex, linear

Across-slope shape: Convex, linear, concave

Parent material: Sandy outwash derived from granite, gneiss, and/or quartzite

Typical profile

Ap - 0 to 9 inches: loamy fine sand

Bw - 9 to 25 inches: loamy fine sand

BC - 25 to 33 inches: fine sand

Cg - 33 to 60 inches: sand

Properties and qualities

Slope: 3 to 8 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Moderately well drained

Runoff class: Very low

Capacity of the most limiting layer to transmit water (Ksat): Moderately high to very high (1.42 to 99.90 in/hr)

Depth to water table: About 15 to 37 inches

Frequency of flooding: None

Frequency of ponding: None

Maximum salinity: Nonsaline (0.0 to 1.9 mmhos/cm)

Sodium adsorption ratio, maximum: 11.0

Available water supply, 0 to 60 inches: Moderate (about 6.5 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 2w

Hydrologic Soil Group: A

Ecological site: F144AY027MA - Moist Sandy Outwash

Hydric soil rating: No

HgB—Hermon sandy loam, 3 to 8 percent slopes

Map Unit Setting

National map unit symbol: 2w9r8

Elevation: 0 to 950 feet

Mean annual precipitation: 31 to 65 inches

Mean annual air temperature: 36 to 52 degrees F

Frost-free period: 90 to 160 days

Farmland classification: Farmland of statewide importance

Map Unit Composition

Hermon and similar soils: 90 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hermon

Setting

Landform: Mountains, hills

Landform position (two-dimensional): Summit, shoulder, backslope

Landform position (three-dimensional): Mountainbase, interfluvium, base slope

Down-slope shape: Convex

Across-slope shape: Convex

Parent material: Sandy and gravelly supraglacial meltout till derived from granite and gneiss

Typical profile

Ap - 0 to 9 inches: sandy loam

Bs1 - 9 to 16 inches: very gravelly sandy loam

Bs2 - 16 to 32 inches: extremely gravelly loamy sand

C - 32 to 65 inches: very gravelly coarse sand

Properties and qualities

Slope: 3 to 8 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Somewhat excessively drained

Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (1.42 to 14.17 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Maximum salinity: Nonsaline (0.0 to 1.9 mmhos/cm)

Available water supply, 0 to 60 inches: Low (about 3.9 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 2s

Hydrologic Soil Group: A

Ecological site: F144BY601ME - Dry Sand

Hydric soil rating: No

HhC—Hermon sandy loam, 8 to 15 percent slopes, very stony

Map Unit Setting

National map unit symbol: 2w9rd

Elevation: 0 to 1,080 feet

Mean annual precipitation: 31 to 65 inches

Mean annual air temperature: 36 to 52 degrees F

Frost-free period: 90 to 160 days

Farmland classification: Not prime farmland

Map Unit Composition

Hermon, very stony, and similar soils: 85 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hermon, Very Stony

Setting

Landform: Mountains, hills

Landform position (two-dimensional): Summit, shoulder, backslope

Landform position (three-dimensional): Mountainbase, mountainflank, side slope, nose slope, interfluvium

Down-slope shape: Convex

Across-slope shape: Convex

Parent material: Sandy and gravelly supraglacial meltout till derived from granite and gneiss

Typical profile

Oa - 0 to 2 inches: highly decomposed plant material

E - 2 to 3 inches: sandy loam

Bhs - 3 to 9 inches: sandy loam

Bs1 - 9 to 16 inches: very gravelly sandy loam

Bs2 - 16 to 32 inches: extremely gravelly loamy sand

C - 32 to 65 inches: very gravelly coarse sand

Properties and qualities

Slope: 8 to 15 percent

Surface area covered with cobbles, stones or boulders: 1.1 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Somewhat excessively drained

Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (1.42 to 14.03 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Maximum salinity: Nonsaline (0.0 to 1.9 mmhos/cm)

Available water supply, 0 to 60 inches: Low (about 4.2 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 6s

Hydrologic Soil Group: A

Ecological site: F144BY601ME - Dry Sand
Hydric soil rating: No

HIB—Hinckley loamy sand, 3 to 8 percent slopes

Map Unit Setting

National map unit symbol: 2svm8
Elevation: 0 to 1,430 feet
Mean annual precipitation: 36 to 53 inches
Mean annual air temperature: 39 to 55 degrees F
Frost-free period: 140 to 240 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Hinckley and similar soils: 85 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hinckley

Setting

Landform: Outwash deltas, outwash terraces, kames, kame terraces, moraines, eskers, outwash plains
Landform position (two-dimensional): Summit, shoulder, backslope, footslope
Landform position (three-dimensional): Nose slope, side slope, base slope, crest, riser, tread
Down-slope shape: Concave, convex, linear
Across-slope shape: Convex, linear, concave
Parent material: Sandy and gravelly glaciofluvial deposits derived from gneiss and/or granite and/or schist

Typical profile

Oe - 0 to 1 inches: moderately decomposed plant material
A - 1 to 8 inches: loamy sand
Bw1 - 8 to 11 inches: gravelly loamy sand
Bw2 - 11 to 16 inches: gravelly loamy sand
BC - 16 to 19 inches: very gravelly loamy sand
C - 19 to 65 inches: very gravelly sand

Properties and qualities

Slope: 3 to 8 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Excessively drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to very high (1.42 to 99.90 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Nonsaline (0.0 to 1.9 mmhos/cm)
Available water supply, 0 to 60 inches: Very low (about 3.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3s
Hydrologic Soil Group: A
Ecological site: F144AY022MA - Dry Outwash
Hydric soil rating: No

Sp—Sebago mucky peat

Map Unit Setting

National map unit symbol: blk0
Elevation: 10 to 2,100 feet
Mean annual precipitation: 34 to 48 inches
Mean annual air temperature: 37 to 46 degrees F
Frost-free period: 80 to 160 days
Farmland classification: Not prime farmland

Map Unit Composition

Sebago and similar soils: 85 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Sebago

Setting

Landform: Bogs
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Talf
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Organic material

Typical profile

Oe - 0 to 36 inches: mucky peat
Oi - 36 to 65 inches: mucky peat

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Very poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high
(1.42 to 6.00 in/hr)
Depth to water table: About 0 inches
Frequency of flooding: None
Frequency of ponding: Frequent
Available water supply, 0 to 60 inches: Very high (about 18.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8w
Hydrologic Soil Group: A/D
Ecological site: F144BY230ME - Acidic Peat Wetland Complex
Hydric soil rating: Yes

Wa—Walpole fine sandy loam

Map Unit Setting

National map unit symbol: blk7
Elevation: 0 to 540 feet
Mean annual precipitation: 48 to 49 inches
Mean annual air temperature: 45 to 46 degrees F
Frost-free period: 145 to 165 days
Farmland classification: Not prime farmland

Map Unit Composition

Walpole and similar soils: 85 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Walpole

Setting

Landform: Outwash plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Talf
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Sandy glaciofluvial deposits

Typical profile

H1 - 0 to 8 inches: fine sandy loam
H2 - 8 to 20 inches: fine sandy loam
H3 - 20 to 65 inches: gravelly loamy sand

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Poorly drained
Capacity of the most limiting layer to transmit water (Ksat): High (2.00 to 6.00 in/hr)
Depth to water table: About 0 to 18 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Low (about 5.7 inches)

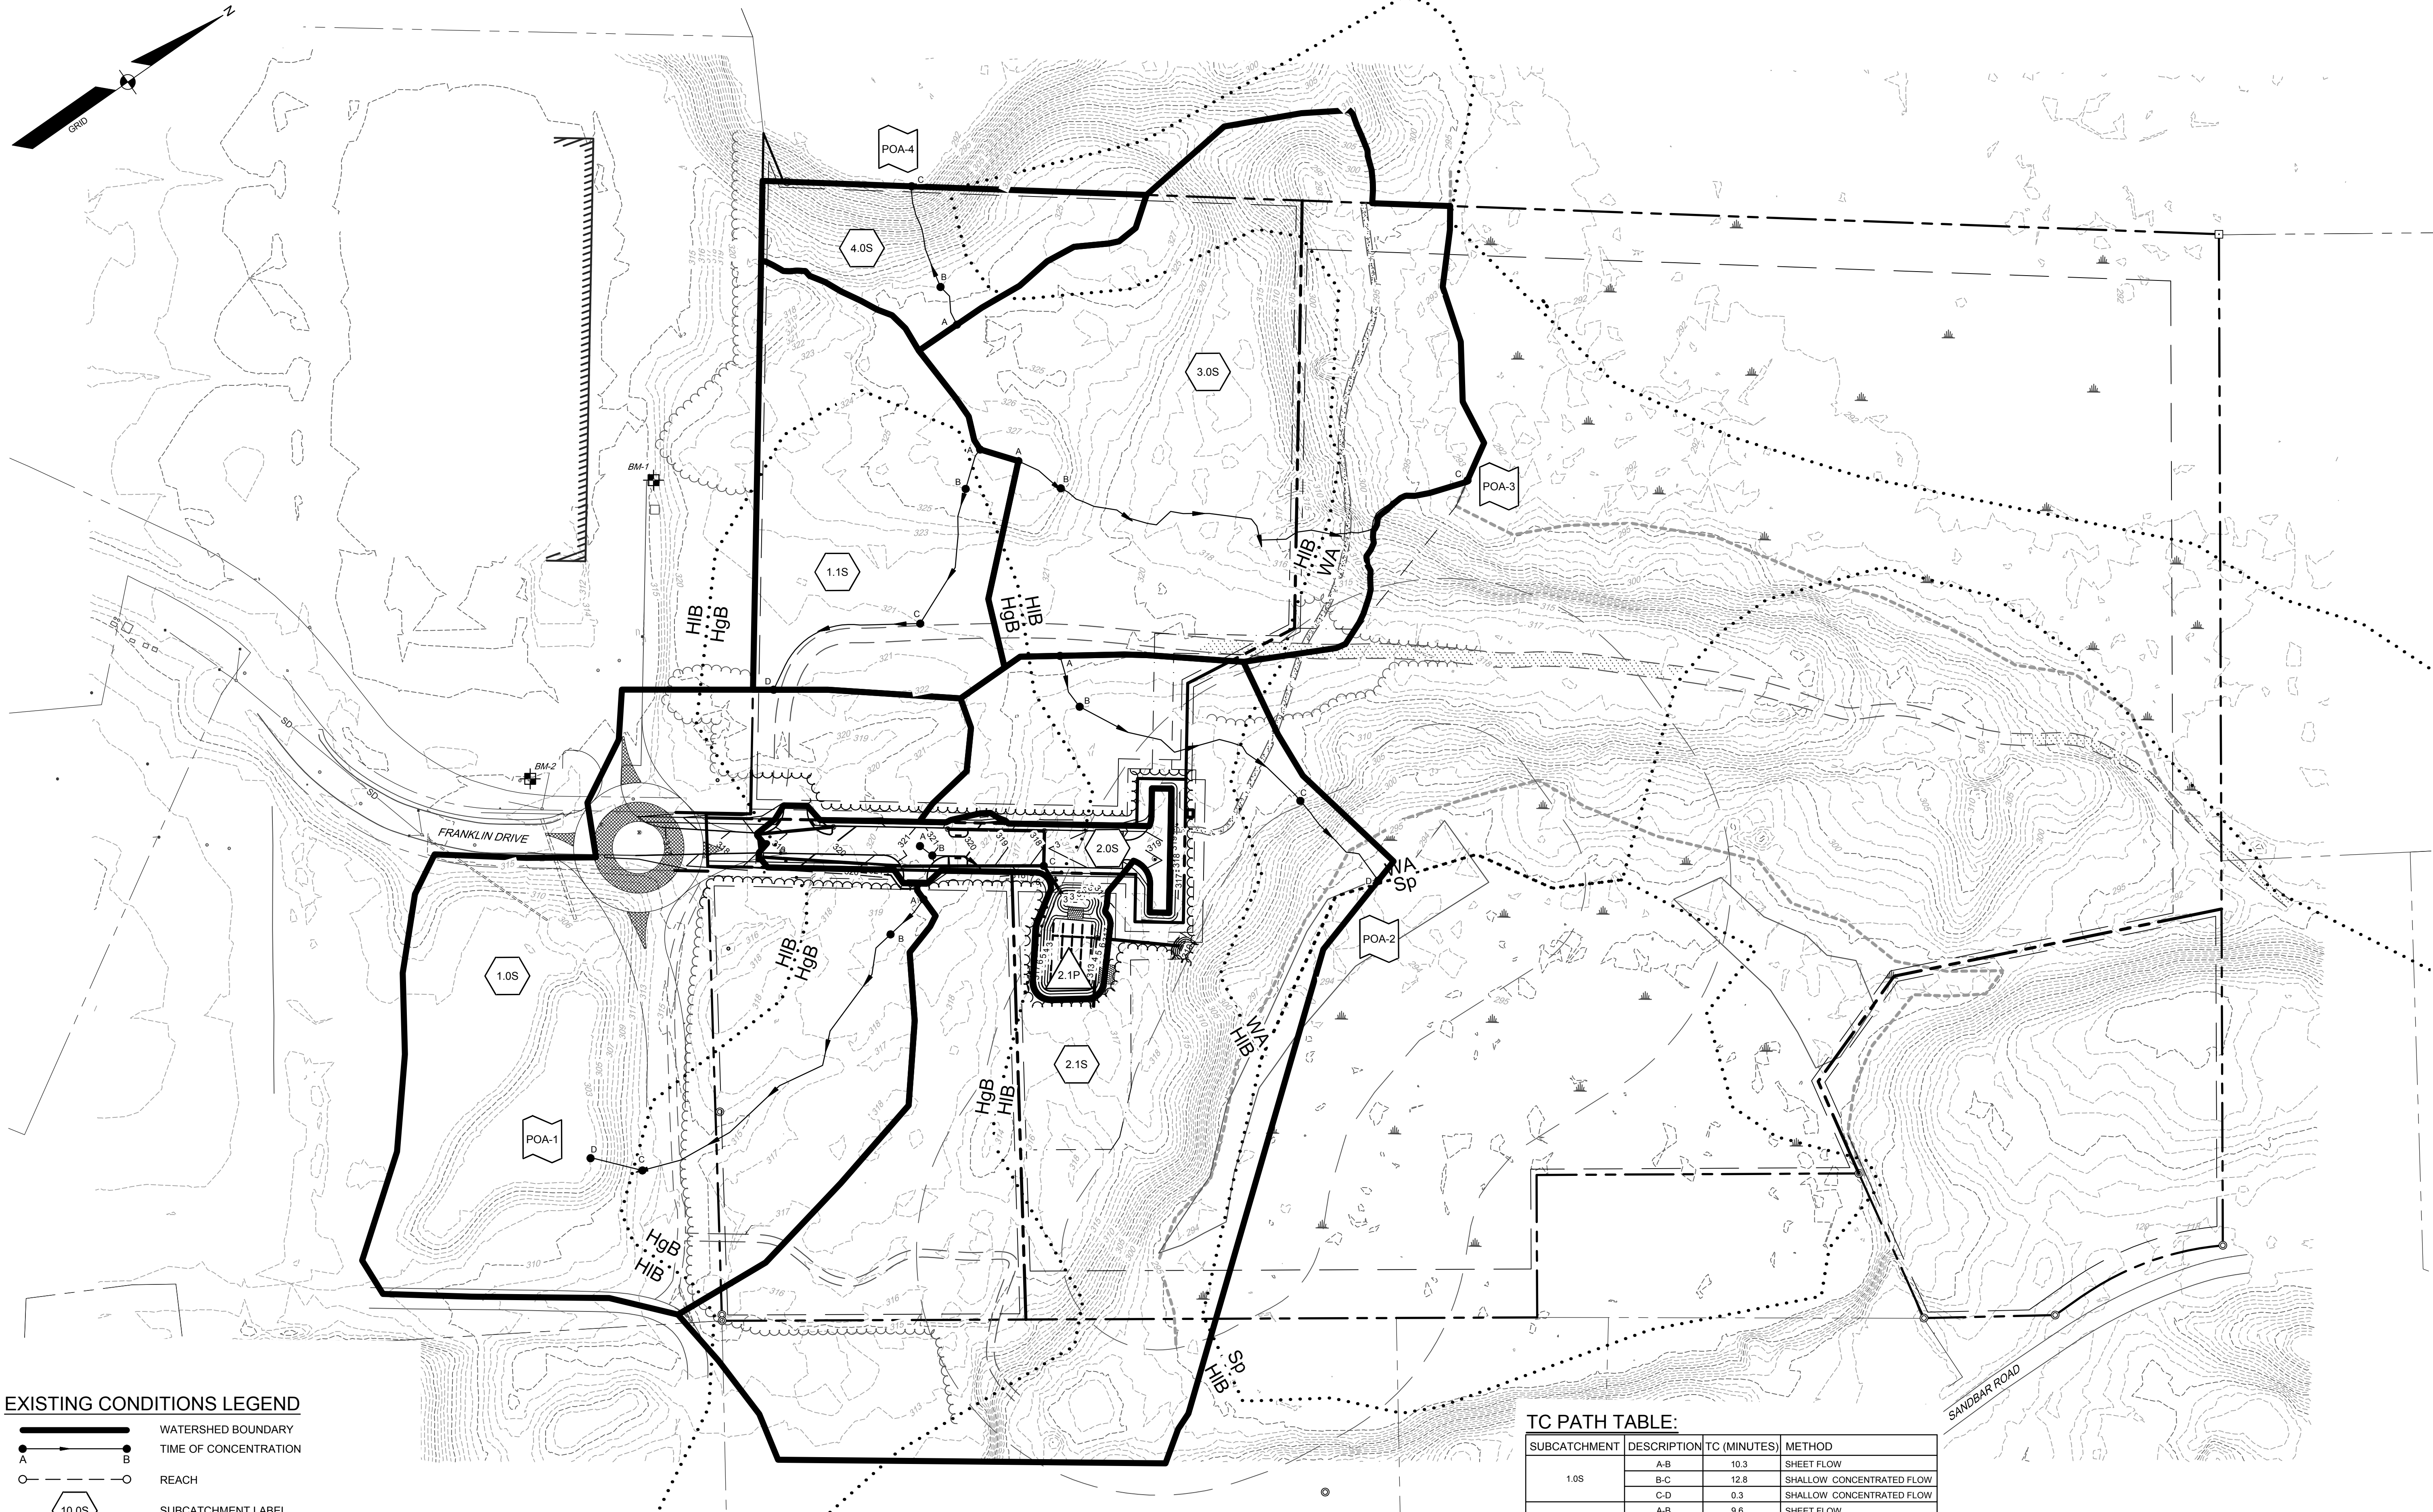

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4w
Hydrologic Soil Group: A/D
Ecological site: F144BY303ME - Acidic Swamp
Hydric soil rating: Yes

▽ After Digging

q_p = Pocket Penetrometer Strength, kips/sq.ft.

KEY TO NOTES & SYMBOLS

Test Boring and Test Pit Explorations

All stratification lines represent the approximate boundary between soil types and the transition may be gradual.

Key to Symbols Used:

w	-	water content, percent (dry weight basis)
q _u	-	unconfined compressive strength, kips/sq. ft. - laboratory test
S _v	-	field vane shear strength, kips/sq. ft.
L _v	-	lab vane shear strength, kips/sq. ft.
q _p	-	unconfined compressive strength, kips/sq. ft. – pocket penetrometer test
O	-	organic content, percent (dry weight basis)
W _L	-	liquid limit - Atterberg test
W _P	-	plastic limit - Atterberg test
WOH	-	advance by weight of hammer
WOM	-	advance by weight of man
WOR	-	advance by weight of rods
HYD	-	advance by force of hydraulic piston on drill
RQD	-	Rock Quality Designator - an index of the quality of a rock mass.
γ _T	-	total soil weight
γ _B	-	buoyant soil weight

Description of Proportions:

Trace:	0 to 5%
Some:	5 to 12%
"Y"	12 to 35%
And	35+%
With	Undifferentiated

Description of Stratified Soils

Parting:	0 to 1/16" thickness
Seam:	1/16" to 1/2" thickness
Layer:	½" to 12" thickness
Varved:	Alternating seams or layers
Occasional:	one or less per foot of thickness
Frequent:	more than one per foot of thickness

REFUSAL: Test Boring Explorations - Refusal depth indicates that depth at which, in the drill foreman's opinion, sufficient resistance to the advance of the casing, auger, probe rod or sampler was encountered to render further advance impossible or impracticable by the procedures and equipment being used.

REFUSAL: Test Pit Explorations - Refusal depth indicates that depth at which sufficient resistance to the advance of the backhoe bucket was encountered to render further advance impossible or impracticable by the procedures and equipment being used.

Although refusal may indicate the encountering of the bedrock surface, it may indicate the striking of large cobbles, boulders, very dense or cemented soil, or other buried natural or man-made objects or it may indicate the encountering of a harder zone after penetrating a considerable depth through a weathered or disintegrated zone of the bedrock.

APPROXIMATE TEST PIT LOCATION

NOTES:

1. EXPLORATION LOCATION PLAN WAS PREPARED FROM A 1"=80' SCALE PLAN OF THE SITE ENTITLED "CONCEPTUAL MASTER PLAN," PREPARED BY SEBAGO TECHNICS, DATED 01/23/2025.
2. THE BORINGS AND TEST PITS WERE LOCATED IN THE FIELD BY S. W. COLE ENGINEERING, INC. USING A MAPPING GRADE GNSS RECEIVER.
3. THIS PLAN SHOULD BE USED IN CONJUNCTION WITH THE ASSOCIATED S. W. COLE ENGINEERING, INC. GEOTECHNICAL REPORT.
4. THE PURPOSE OF THIS PLAN IS ONLY TO DEPICT THE LOCATION OF THE EXPLORATIONS IN RELATION TO THE EXISTING CONDITIONS AND PROPOSED CONSTRUCTION AND IS NOT TO BE USED FOR CONSTRUCTION.

Bottom of Exploration at 27.0 feet

Stratification lines represent approximate boundary between soil types, transitions may be gradual. Water level readings have been made at times and under conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the time measurements were made.

TEST PIT TP-201

DATE: 4/28/2025 LOCATION: See Exploration Location Plan SURFACE ELEVATION (FT): 317' +/- COMPLETION DEPTH (FT): 7.5
WATER LEVEL DEPTHS (FT): No Free Water Observed REMARKS:

Depth (feet)	Graphic Log	Stratum Description	H ₂ O Depth	Sample No.	Type	Sample Depth (ft)	Field / Lab Test Data
		Forest Duff / Topsoil					
0.5		Orange-brown to brown, gravelly SAND, some silt, with roots					
2.0		Light brown, SAND AND GRAVEL, trace silt, with frequent cobbles and boulders					
5		Guelph Permeameter Test @ 4.5': Unsaturated Infiltration Rate = 22.9 in / hr					w =7.2 %

Bottom of Exploration at 7.5 feet

Stratification lines represent approximate boundary between soil types, transitions may be gradual. Water level readings have been made at times and under conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the time measurements were made.

KEY TO NOTES AND SYMBOLS:

Water Level
▽ At time of Digging
▼ At Completion of Digging
▽ After Digging

q_p = Pocket Penetrometer Strength, kips/sq.ft.

KEY TO NOTES & SYMBOLS

Test Boring and Test Pit Explorations

All stratification lines represent the approximate boundary between soil types and the transition may be gradual.

Key to Symbols Used:

w	-	water content, percent (dry weight basis)
q _u	-	unconfined compressive strength, kips/sq. ft. - laboratory test
S _v	-	field vane shear strength, kips/sq. ft.
L _v	-	lab vane shear strength, kips/sq. ft.
q _p	-	unconfined compressive strength, kips/sq. ft. – pocket penetrometer test
O	-	organic content, percent (dry weight basis)
W _L	-	liquid limit - Atterberg test
W _P	-	plastic limit - Atterberg test
WOH	-	advance by weight of hammer
WOM	-	advance by weight of man
WOR	-	advance by weight of rods
HYD	-	advance by force of hydraulic piston on drill
RQD	-	Rock Quality Designator - an index of the quality of a rock mass.
γ _T	-	total soil weight
γ _B	-	buoyant soil weight

Description of Proportions:

Trace:	0 to 5%
Some:	5 to 12%
"Y"	12 to 35%
And	35+%
With	Undifferentiated

Description of Stratified Soils

Parting:	0 to 1/16" thickness
Seam:	1/16" to 1/2" thickness
Layer:	1/2" to 12" thickness
Varved:	Alternating seams or layers
Occasional:	one or less per foot of thickness
Frequent:	more than one per foot of thickness

REFUSAL: Test Boring Explorations - Refusal depth indicates that depth at which, in the drill foreman's opinion, sufficient resistance to the advance of the casing, auger, probe rod or sampler was encountered to render further advance impossible or impracticable by the procedures and equipment being used.

REFUSAL: Test Pit Explorations - Refusal depth indicates that depth at which sufficient resistance to the advance of the backhoe bucket was encountered to render further advance impossible or impracticable by the procedures and equipment being used.

Although refusal may indicate the encountering of the bedrock surface, it may indicate the striking of large cobbles, boulders, very dense or cemented soil, or other buried natural or man-made objects or it may indicate the encountering of a harder zone after penetrating a considerable depth through a weathered or disintegrated zone of the bedrock.
